

GaAs MMIC SOT26 SPDT SWITCH, DC- 3 GHz

Typical Applications

The HMC197BE is ideal for:

- MMDS & WirelessLAN
- PCMCIA Wireless Cards
- Portable Wireless

Features

- Low Insertion Loss: 0.4 dB
- Ultra Small Package: SOT26
- Input IP3: +59 dBm
- Positive Control: 0/+3V @ 3 μ A

General Description

The HMC197BE is a low-cost SPDT switch in a 6-lead SOT26 plastic package for use in general switching applications which require very low insertion loss and very small size. The device can control signals from DC to 3 GHz and is especially suited for 900 MHz, 1.8 - 2.2 GHz, and 2.4 GHz ISM applications with less than 1 dB loss. The design provides exceptional insertion loss performance, ideal for filter and receiver switching. RF1 and RF2 are reflective shorts when "Off". The two control voltages require a minimal amount of DC current and offer compatibility with most CMOS & TTL logic families. See HMC221BE for same performance in an alternate SOT26 pin-out.

Electrical Specifications, $T_A = +25^\circ \text{C}$, $V_{ctl} = 0/+3$ to $+8 \text{Vdc}$, 50 Ohm System

Typical Application Circuit

Notes:

1. Set logic gate and switch Vdd = +3V to +5V and use HCT series logic to provide a TTL driver interface.
2. Control inputs A/B can be driven directly with CMOS logic (HC) with Vdd of 5 to 8 Volts applied to the CMOS logic gates.
3. DC Blocking capacitors are required for each RF port as shown. Capacitor value determines lowest frequency of operation.
4. Highest RF signal power capability is achieved with Vdd = +8V and A/B set to 0/+8V.

[2] Circuit Board Material: Rogers 4350

The circuit board used in the final application should be generated with proper RF circuit design techniques. Signal lines at the RF port should have 50 Ohm impedance and the package ground leads and package bottom should be connected directly to the ground plane similar to that shown above. The evaluation circuit board shown above is available from Analog Devices Inc. upon request.
